IPC Code: [H01M 6/08](#); [H01M 4/75](#);

Abstract: PURPOSE: To prevent an air ingress from a carbon rod even after a long storage period and manufacture a dry battery of high sealing performance by providing a paraffin thin film on the edge of the carbon rod in a manufacture process.

CONSTITUTION: The predetermined amount of paraffin 5 is applied to the upper edge of a carbon rod 4 provided at the center of a positive pole laminating agent 3 stored in a zinc can 1 and then the paraffin 5 is fused under a heating atmosphere like the exposure of a dry battery to heating in a furnace. After cooling and solidification, a thin film of the paraffin 5 is formed on the upper edge of the carbon rod 4. In this case, the amount of the paraffin 5 applied to the upper edge of the carbon rod 4 is so decided as to form a thin film covering, for example, 30% to 70% of the upper edge area of the carbon rod 4. Consequently, the paraffin 5 is formed on the upper edge of the carbon rod 4 after heating. Thereafter, upper cover paper 6 is placed on the positive pole laminating agent, a sealing agent 7 comprising pitch and the like is applied to the external surface of the carbon rod 4 and furthermore a synthetic resin sealing body 8 having a carbon rod insertion hole is kept in contact with the opening of the zinc can 1. And a metal negative terminal plate 11 is positioned on the bottom of the zinc can 1 and a metal positive terminal plate 10 is fitted on the sealing body 8.
